

Securing Business Networks

How Protected is your network?

An effective security program is an ongoing activity that requires considerable time, effort and knowledge of the latest security threats. Identifying the right processes and technology to deploy in your organization to keep it secure can be overwhelming. D&E strives to bring your business to the highest levels of network and computer security possible. Through our knowledgeable consultants and engineers as well as industry leading partnerships, we take the time to understand your needs and move you on the path to a more secure infrastructure.

Service Offerings Penetration Testing

Testing the security of installed equipment and software to identify security holes that could be exploited by hackers and internal threats to compromise your network.

Vulnerability Assessment

Identifying security vulnerabilities within your organization and then prioritizing remediation recommendations so that you can respond quickly to those systems and applications most at risk.

Audit

Reviewing current processes and practices as well as device configurations to ensure a sound security infrastructure.

Configuration & Planning

Designing and building the best technology solutions for a secure network, while keeping company needs as the driving force behind the design.

Security Monitoring

Helping you evaluate current security, detect misuse and violations, respond to incidents and implement changes to improve your defenses.

Design

Creating the policies, standards and procedures that form the foundation for trusted e-business, as well as the security architecture and design specifications that best fit your requirements.

Forensic Analysis

Determining what happened to cause a computer incident and determining how it occurred in a documented and reproducible manner and reporting that information in clear, non-technical terms.

Wireless Security

Working with you as you deploy wireless solutions, to ensure the right technology is configured for optimum security levels.

Next Steps

Identifying and then eliminating or reducing security vulnerabilities is critical to minimizing risk. Security threats and the technology to minimize them are constantly evolving. Successful protection requires an ongoing, process oriented approach. Contact D&E today to learn more about solutions that are available so that your organization is staying one step ahead of attacks.
